Office Action Summary

Application No.

10/656,416

Applicant(s)

BEASLEY ET AL.

Examiner

Dennis Cordray

Art Unit

1731

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 07 April 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-22 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-22 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____.
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

DETAILED ACTION

Claim Rejections - 35 USC § 103

The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claims 1-2, 4-6, 8 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Clapp (1765860).

Clapp discloses a multi-layer liner board or paper comprising a bottom layer of cellulosic fibers and a top layer having 5-20 parts by weight bleached sulphite pulp, 10-20 parts wood flour or sawdust, and 75 to 105 parts other material (Claim 1; p 1, lines 58-72; p2, lines 5-13, 71-74). The sawdust can thus be present in the top layer in an amount between 7.4 and 20% by weight. The sawdust particles are capable of passing through a 40-80 mesh sieve (particle size range from about 177 to about 420 μm). The range of acceptable particle sizes significantly overlays the claimed range and it would have been obvious to a person skilled in the art at the time of the invention to use sawdust with at least 95% of the particles having a size between 350 and 420 μm with a reasonable expectation of success in producing an acceptable paperboard. Although the densities of the layers is not disclosed, the two layers are made from very different compositions of materials and would obviously have very densities (the top layer includes 50 to 70 parts by weight of china clay or kaolin, which is much denser than the fibers). Clapp discloses that the layers of the sheet are contacted prior to drying (p 1, lines 75-84). Clapp is silent as to the thickness of the layers; however, the reference

Art Unit: 1731

encompasses embodiments wherein the top layer is of sufficient mass that the overall sheet contains greater than 1% sawdust by weight.

Claims 1-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chance et al (5770013) in view of Clapp or McCowan (5203965).

Chance et al discloses a 3-ply paperboard comprising wood (cellulose) fibers and sawdust. The wood fiber material is present in an amount of about 20-25% by weight of the paper and comprises from 5-70% sawdust (col 4, lines 36-39 and col 8, lines 32-38). Thus, the amount of sawdust that can be present by weight of the multi-ply paper can be from 1 to 17.5%, which significantly overlaps the claimed ranges.

Chance et al does not disclose the particle size of the sawdust.

Clapp discloses a multi-layer liner board or paper comprising wood flour or sawdust with particle sizes from about 177 to about 420 μm . Clapp discloses that the product made using sawdust with the disclosed particle sizes forms well on a cylinder mould (p 2, lines 71-76).

McCowan et al discloses that making a paper using sawdust that has been screened to a particle size of greater than about 1/16 inch (about 1590 μm) results in paper having good strength properties. McCowan also discloses that the paper can have at least 30% sawdust (Abstract; col 1, lines 37-44; col 4, line 51 to col 5, line 11).

The art of Chance et al, Clapp, McCowan and the instant invention are analogous because they deal with the making of paper in general and specifically paperboard having sawdust particles. It would have been obvious to one skilled in the

Art Unit: 1731

art at the time of the invention to obtain 95% of sawdust particles having a size between 1590 and 3175 μm or between 350 and 420 μm in the paperboard of Chance et al in view of Clapp or McCowan to obtain good strength or formation properties.

Claims 5-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chance et al in view of Clapp or McCowan and further in view of Gomez (5227024) and Qiu et al (5505395).

Chance et al discloses that the three layers are brought into contact before the drying stage of the process (col 5, lines 57-67).

Chance et al, Clapp and McCowan do not disclose that at least two low density layers are sandwiched between two high density layers. Chance et al, Clapp and McCowan further do not disclose the sawdust content of at least one high density layer.

Qiu et al discloses a spirally wound paperboard tube having multiple plies of lower and higher densities, wherein the lower density paperboard is at least 3% lower than the higher density paperboard. The tube has at least one lower density layer sandwiched between two higher density structural layers (Abstract). Qiu et al also discloses that in a preferred embodiment, there are at least two centrally located lower density layers (col 3, lines 66-67 and col 4, lines 1-2). Qiu et al further discloses that the plies are coated with adhesive prior to winding to adhere them together (col 8, lines 47-49). Qiu et al teaches that it is well known in the art to use paperboard plies of widely varying densities to form paperboard tubes and that the densities range from 0.5 to 0.9 g/cm^3 (col 6, lines 60-66).

Art Unit: 1731

Qiu et al teaches that the density of paperboard can be varied by varying raw materials or additives (col 6, line 67 and col 7, lines 1-3). Qiu et al does not teach that adding sawdust can change the density of the paperboard.

Gomez discloses a process for reducing the density of a paper by adding inexpensive vegetable filler (such as waste wood from sawing and planing processes) (Abstract; col 5, lines 58-63). While Gomez uses sawdust particles smaller than 150 μm in size, the size limitation is required for good sheet formation and minimizing defects in uniformity and not for lowering density (col 6, lines 9-16).

The art of Chance et al, Clapp, McCowan, Qiu et al, Gomez and the instant invention are analogous because they deal with the making of paper and paperboard products. It would have been obvious to one skilled in the art at the time of the invention to use layers of different densities in the paperboard of Chance et al in view of Clapp or McCowan and further in view of Qiu et al and Gomez to lower the cost of the paperboard (via addition of sawdust) yet maintain structural strength with the high density layer. It would have also been obvious to include sawdust in the high density layer for cost savings or to omit it if higher strength is needed. It would have been obvious to adhere the layers together to incorporate strength into the final multi-layered sheet. Since a common use of paperboards is the formation of multi-layered paperboard tubes, it would have been obvious to a person of ordinary skill in the art to make paperboard tubes having multiple layers with the inexpensive lower density layers in the center of the wall sandwiched by the stronger high density layers to provide structural strength.

Art Unit: 1731

Claims 19-22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chance et al in view of Clapp or McCowan and further in view of Gomez, Qiu et al and Howard et al (6033352).

Chance et al, Clapp, McCowan, Gomez and Qiu et al do not disclose that a paperboard ply wound to form a tube is overlapped on itself.

Howard et al discloses various methods for winding paperboard plies to form a spirally wound tube. In one method, the final ply is wrapped to overlap itself at the seam (col 4, lines 37-41).

The art of Chance et al, Clapp, McCowan, Qiu et al, Gomez, Howard et al and the instant invention are analogous because they deal with the making of paperboard and paperboard products.

It would have been obvious to one skilled in the art at the time of the invention to overlap the paperboard winding on itself to make a tube with the paperboard of Chance et al in view of Clapp or McCowan and further in view of Qiu et al, Gomez and Howard et al to increase the strength of the tube.

Response to Arguments

Applicant's arguments, see pp 2-5, filed 4/7/2006, with respect to the rejection(s) of claim(s) 1-4 under 35 U.S.C 103(a) have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, new grounds of rejection have been made above in view of a different interpretation of the previously applied references as well as newly found prior art.

Art Unit: 1731

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure, Sealey, II et al (US 2002/0155292). The reference discusses the meaning of the term "sawdust" as well as recites several examples of particle size distributions for sawdust, thus aids in clarification of the instant application.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Dennis Cordray whose telephone number is 571-272-8244. The examiner can normally be reached on M - F, 7:30 -4:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Steven Griffin can be reached on 571-272-1189. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
